Party-Keg Filler **SEMI - fill**

Worldwide the established way to fill party kegs in large quantities

Our Philosophy...

The semi-automatic party-keg-filler is available with 2, 4 and 6 filling heads and a capacity beginning from 100 up to 300 keg / h.

The keg is placed manually onto the filler and lifted by two-hand-operation! A sensor recognizes the arriving of the keg and starts automatically the filling process.

The pre-air valve and the return-air valve will open. The keg gets purged with CO₂ for approximately 5 seconds and the air will be removed from the keg. The keg is pressurized. The beer valve and the return-air valve are opened simultaneously and the keg will be filled from bottom to top. A sensor probe – installed into the return-air channel – controls the filling process. A lamp indicates the finished filling process – the beer valve will be closed.

The return-air valve stays open for a moment to relieve the filling pressure inside the keg to prevent any spilling when removing the keg from the filling head.

The filler is available as a solitary unit, but upon request, also as a AUTO-fill SYSTEM with conveyors, de-capper, ink printer, semi-automatic or automatic closer, turner with rinser and air-blow station.

Kunde:
Privatbrauerei
Gaffel Becker & Co.
Typ:
SEMI-fill Systems
Leistung:
500 Fässer/Std.
